Personal Profile

BCA graduate from CHARUSAT targeting Cloud and DevOps roles. Built projects around IAM, CI/CD visibility, and container security using Docker, Kubernetes, Helm, and ArgoCD. Automated pipelines with Jenkins and GitHub Actions, enforced supply chain security with Trivy, Cosign, and Kyverno, and worked with AWS - ECR, IAM, EC2, and VPC, with a focus on least-privilege infrastructure and observable systems.

Technical Skills

Cloud & AWS: EC2, IAM, S3, VPC, Lambda, CloudWatch, CloudTrail, DynamoDB, ElastiCache, SNS, SQS, Systems Manager
DevOps: Linux, Docker, Kubernetes, ArgoCD, Jenkins, OpenTelemetry, Helm, Nginx, Kind, Trivy, Prometheus, Grafana, GitHub Actions
Languages: Python, Go, JavaScript/TypeScript, C/C++, Java, Bash, SQL

Experience

AWS Infrastructure Engineering January 2026 – Present
Self-Directed Training | AWS Skill Builder Remote

- Configured IAM with **least-privilege separation** between admin and operational access across users, groups, and roles; set up CloudWatch dashboards and CPU alarms at **80%** threshold.
- Provisioned EC2 with key-based auth; audited billing, identified **3 cost drivers**, applied right-sizing on personal account instances.
- Designed a **multi-tier VPC** with public/private subnets, NAT gateway, VPC peering, security groups.

Projects

AegisMesh - IAM [↗](#) | *React 19, PostgreSQL, Prisma, Docker, Kubernetes, Jenkins, Grafana* Ongoing

- Built an IAM-style policy engine with **deny-first evaluation**, role inheritance, and policy simulation.
- Implemented layered auth - TOTP MFA, OAuth 2.0, JWT refresh rotation, and step-up auth for sensitive actions - to match production security requirements.
- Containerized with **Docker** (multi-stage builds, Compose); deployed on local **Kubernetes** with Kustomize. **Jenkins** pipeline with parallel install/test/build stages and credentials binding.
- Prometheus + Grafana observability with live metrics - **request rate, error rate, latency, auth/MFA/security events**, and audit log writes - via prebuilt dashboard.

HookDrop - Mock Webhook Receiver [↗](#) | *Go, ArgoCD, Cosign, Kubernetes, Helm, AWS ECR, GitHub Actions* Ongoing

- Webhook capture service in Go - accepts any POST to a bucket URL, stores last 50 events in-memory, and streams arrivals live via **SSE** with trace ID logging.
- GitOps pipeline** - GitHub Actions runs **Trivy** scans, signs with **Cosign** OIDC, pushes to **AWS ECR**, and bumps Helm values so **ArgoCD** syncs automatically. **Renovate** handles dependency PRs.
- Hardened runtime** - non-root UID, read-only filesystem, dropped capabilities. **Kyverno** blocks latest tags, missing resource limits, and unsigned images at admission. **OpenTelemetry** traces, **Prometheus** metrics, and **Loki** logs feed **Grafana** with **Alertmanager** on top.

DeployLens [↗](#) | *TypeScript, AWS CodeDeploy, GitHub Actions, PostgreSQL, Prisma, Socket.io* 2025-2026

- Correlated GitHub Actions and CodeDeploy events via commit SHA into a single **deployment view** with real-time status via Socket.io.
- Ingested deployment events via **webhooks** with polling fallback; computed unified deployment status across environments.
- Secured with CSRF, webhook signature validation, and **AES-256-GCM encrypted credential storage**.

Education

Charotar University of Science and Technology (CHARUSAT) Changa, Gujarat
Bachelor of Computer Applications (BCA) – CGPA: 8.9 2023 – 2026

Certifications

AWS Cloud Practitioner Essentials [↗](#)
AWS Cloud Quest: Cloud Practitioner [↗](#)
